

foundation plan:

- ) all measurements in cm
- ) the depth of the foundation is depending on the prevailing ground structure on site
- foundation points

Foundation Notes:

This plan is produced by the building manufacturer, the size of the pads are calculated on the kN point loadings of the building

However, many clients prefer to form a 2 strip foundation as per the overall length of the building, in this case 6060mm & also cloak the 2440mm depth, this helps stop vermin and spoil from getting under the building & also gives a neater finish to the site

We suggest a strip width of 300mm-400mm, depending on the individual site condition, with a minimum depth of 300mm. This can be formed in either concrete or blocks on a concrete base
